Lithium Disilicate
Redefined

GC Initial[®] LiSi Press

The revolutionary pressable ceramic

Finally! A lithium disilicate ceramic with the aesthetics and strength technicians demand without being low in value.

Imagine a pressable ceramic that is exceptionally strong, extremely durable, with amazing aesthetics and saves your lab significant time!

The first lithium disilicate ceramic with HDM technology

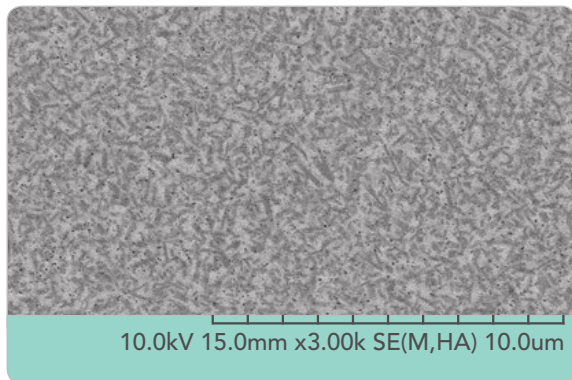

GC Initial® LiSi Press is the first lithium disilicate ceramic ingot with High Density Micronization (HDM), a technology unique to GC that provides exceptional physical properties and the most natural, life-like aesthetics. HDM uses equally dispersed lithium disilicate micro-crystals to fill the entire glass matrix rather than using traditional larger size crystals that do not take full advantage of the matrix structure. The result is the ultimate combination of strength and aesthetics, making GC Initial® LiSi Press perfectly suitable for all types of restorations through all levels of transparency. Most importantly, HDM technology helps ensure the product remains extremely stable, without distortion or drop in value, even after multiple firings.

GC Initial® LiSi Press has an extremely high density thanks to:

- optimized components
- a proprietary innovative new manufacturing technology (HDM technology)

High Density Micronization

GC Initial® LiSi Press
HDM - High Density Micronization

Conventional lithium disilicate ceramic

Press for a beautiful smile

GC Initial® LiSi Press is optimized to be used with the rest of the GC Initial® family, including the already proven GC Initial® LiSi veneering ceramic and GC Initial® Lustre Pastes NF – our universal 3D paintable ceramics, further enhancing aesthetics over the widest possible indications. Do not forget to use GC Initial® LiSi Press with our dual-cure adhesive resin cement, G-CEM LinkForce®, and you will achieve extraordinarily strong and durable bonds.

- Exceptional flexural strength
- Amazing aesthetics
- Rich, warm, bright colors with excellent fluorescence
- Predictable material and color stability after repeated firings
- Optimized for use with GC Initial® LiSi veneering ceramic and GC Initial® Lustre Pastes NF
- Real time savings
- Low solubility
- Antagonist-friendly and wear-resistant
- Almost no reaction layer when divested
- Cleaner presses
- No hydrofluoric acid necessary
- Seamless learning curve

Available in 4 translucencies

High Translucency (HT) – Enamel replacement

Best transparency match to natural tooth enamel, does not look dark (low value) in the mouth.

Courtesy of Hiroaki Tada, RDT

Medium Translucency (MT) – Press & Stain

VITA Shade* line-up with warm colors from the GC Initial family of ceramic materials.

Courtesy of Bill Marais, RDT

Low Translucency (LT) – One body concept A, B, C, D or Layer

Compact color line-up following the One Body concept.

Courtesy of Myung Joo Shin

Medium Opacity (MO) – Layering

Thanks to strong fluorescence, a life-like sense of color can be reproduced when veneering GC Initial LiSi Porcelain.

Courtesy of Olivier Tric, MDT

*VITA Shades are a product of VITA Zahnfabrik.

Invest & Press GC LiSi PressVest

Investing made easy!

- High fluidity
- Long working time
- Stable setting time
- More flexible time to furnace
- Time savings – great for lab work flow
- Wider spruing capacity
- Better internal adaptation
- Easy removal of reaction layer
- No hydrofluoric acid necessary

It's simply easy to use!

There is only a minimal reaction layer with GC LiSi PressVest, and it is easily removed just with glass beads. There is no need for hazardous hydrofluoric acid or alumina blasting. A key element in reaction layer inhibition is the GC LiSi PressVest SR (Surface Refining) Liquid, which is lightly sprayed on the intaglio before investing.

Courtesy of Al Hodges, CDT

GC Initial[®] LiSi Press

Embedded investment reaction layer
Conventional lithium disilicate press ceramic system

The Secret of GC LiSi PressVest

Less generation and easier removal of reaction layer

GC Initial® LiSi Press

Smooth, clean press

By using a unique release agent in the investment powder and GC LiSi PressVest SR liquid, a gap or "tear off line" is created, resulting in an easily broken reaction layer.

Blasting

GC LiSi PressVest SR Liquid is sprayed to the intaglio (inside) of the crown, in which there is generally a stronger reaction layer.

Conventional lithium disilicate press ceramic

Reaction layer:
Hybrid layer consisting of investment and press material

Blasting

High fluidity & long working time

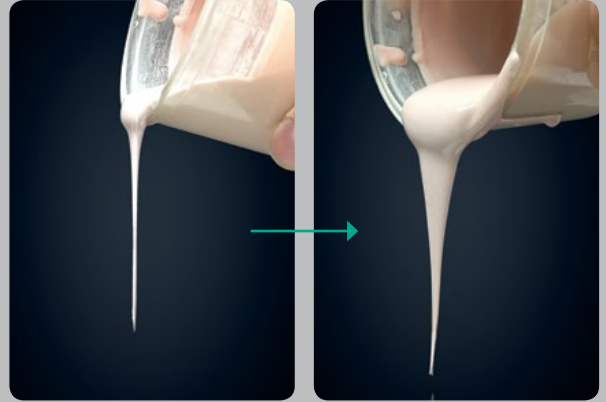

GC LiSi PressVest

1 min. after mixing

5 min. after mixing

Conventional investment material

1 min. after mixing

3 min. after mixing

Time until inserting invested pattern into burn out oven

20 min. to 180 min.

Invested pattern can be inserted into oven up to 160 minutes.

30 min. to 45 min.

Only 15 minutes is allowed until placing in oven.

Time saving

GC Initial® LiSi Press

Time saved: Between 15-20 minutes.
No need for hydrofluoric acid.
